

The smart way to manage your business information!

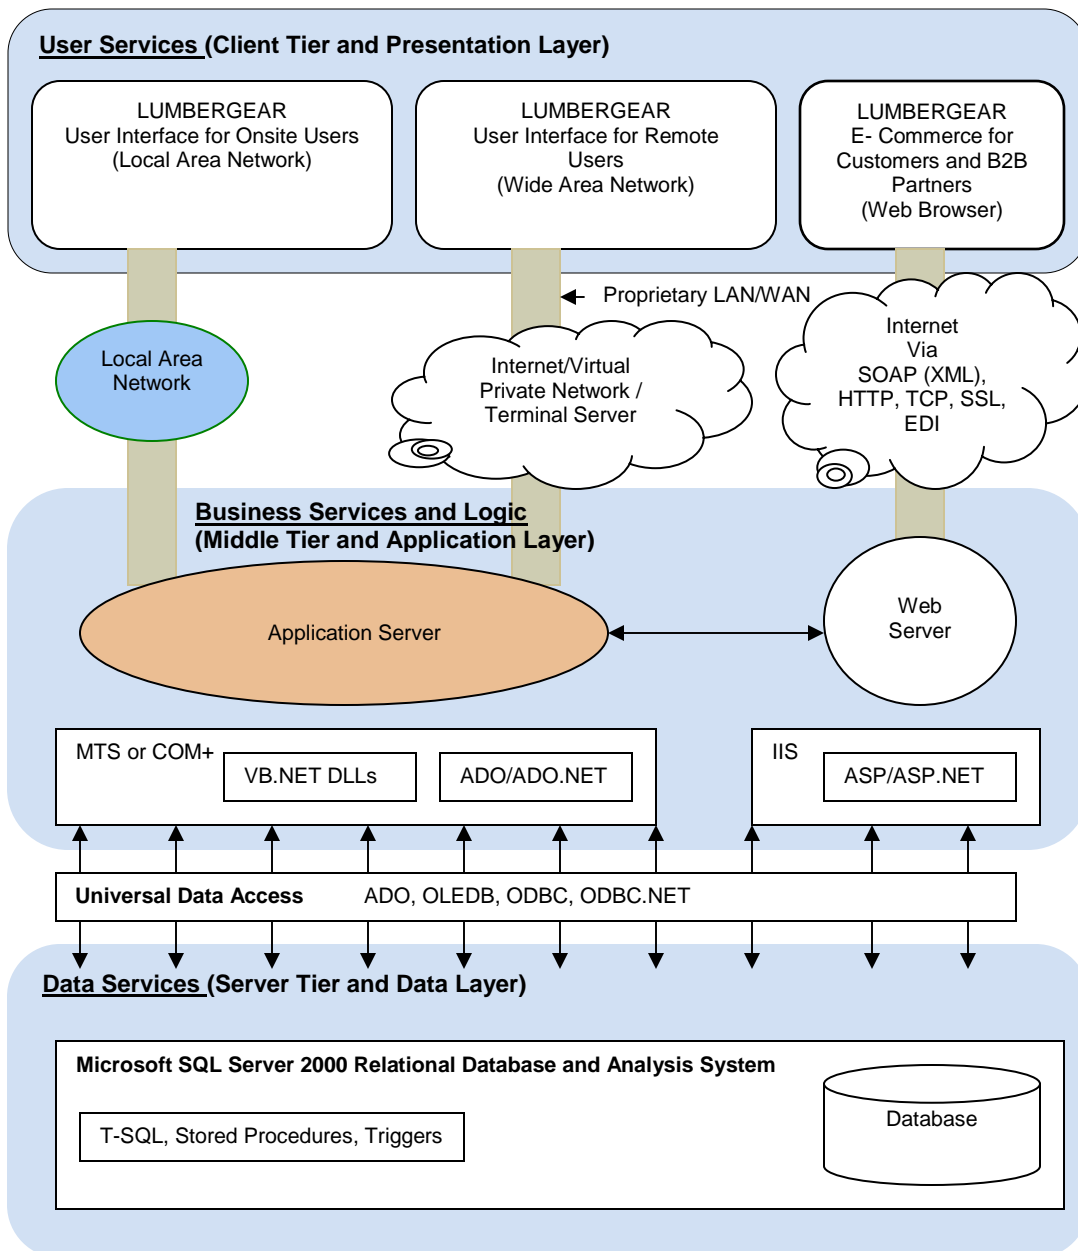

LUMBERGEAR

Product Architecture and Technology

The current version of LUMBERGEAR was developed using Microsoft technologies such as VB.NET 2003, Visual Basic for Applications, Microsoft Office System and SQL Server 2000. All these allow our solution to operate well on the Microsoft Platform.

Integration with other technologies and systems is also taken into consideration, and LUMBERGEAR integrates well with accounting and financial software packages, as well as other reporting software.

This brochure is meant to provide your advanced technology users with an abstract view of how LUMBERGEAR achieves its goals and ensures customer satisfaction through the effective use of technology.

Right Language for the Right Task

A strategic decision was made to develop LUMBERGEAR with several development technologies instead of just a single technology to leverage the advantages of those technologies and the tasks that need to be performed.

Integration

Using the Microsoft Platform to run and implement LUMBERGEAR will serve clients well because majority of lumber companies run their operations on Microsoft product and technologies.

Having LUMBERGEAR implemented on the Microsoft platform provides a more stable system with better communication among services.

Web Services

Web services are similar to Windows component object model (COM) and make it easier for different systems to integrate well with one another through the use of XML –based Web services. The flexibility and ease of use allow easy exchange of information regardless of platform, programming language, and operating systems.

Scalability

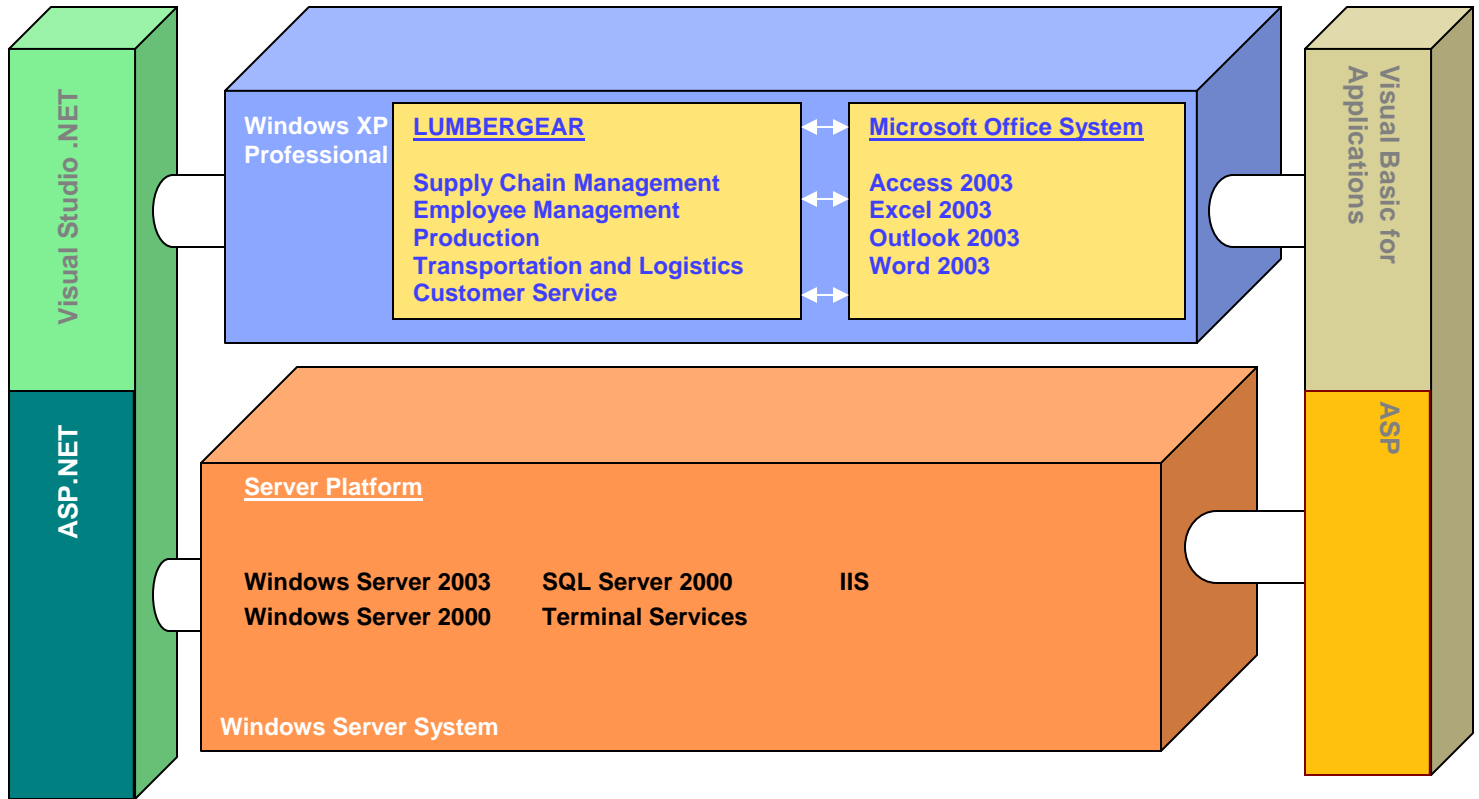

As your organization grows, the technology and architecture based on the Microsoft platform allows your LUMBERGEAR solution to be scaled as large as you want.

Smart Tag Technology

Smart Tag provides you with a quick easy way to perform functions that you would open other programs to perform.
